## TIME: 11.30-2.30 PM

INSTRUCTIONS The paper consists of EIGHT questions. Answer any FIVE questions.

## ALL questions carry equal marks.

## Show all your working

1.	a)	evaluate the middle term in the binomial expansion of $(2x + 3y)^8$ and determine		
		its value when $x = \frac{1}{3}$ and $y = \frac{1}{2}$ .	(7 marks)	
	b)	Find the first four terms in the binomial expansion of $(1 + \frac{1}{2}x)^{\frac{-1}{3}}$ , and state the		
		values of x for which the expansion is valid.	(3 marks)	
	c)	(i) Use the binomial theorem to expand $\sqrt{(\frac{1-x}{1+x})}$ as far as the fourth te	erm.	
		(ii) By setting $x = \frac{1}{15}$ in first three terms in (i), determine the approx	By setting $x = \frac{1}{15}$ in first three terms in (i), determine the approximate value	
		of $\sqrt{14}$ corect to four decimal places.	(10 marks)	
2.	(a)	Simplify the expression: $\frac{(1-x)^{\frac{1}{2}} - x(1-x)^{-\frac{1}{2}}}{1-x}$	(3 marks)	
	(b)	Evaluate: $2^{(2x+2)} - 7(2^x) + 3 = 0$ , correctto four decimal places.	(10 marks)	
	(c)	Three forces, $F_1$ , $F_2$ and $F_3$ in newtons, necessary for the equilibrium of a mechanical		
		system satisfy the simultaneous equations:		

F1 - 2F2 + F3 = 1-2F1 + 3F2 + 2F3 = 83F1 + 4F2 - 3F3 = 5Use the method of elimination to solve the equations. (7 marks) Given that  $5\cosh x + 3\sinh x = pe^{x} + qe^{-x}$ , determine the value of p and q. (4 marks) 3. (a) Prove the identities: (b)  $\operatorname{cosech}^2 x = \operatorname{coth}^2 x - 1$ (i)  $\cosh 3x = 4\cosh^3 x - 3\cosh x$ (ii) (8 marks) (c) Solve the equation:  $2\cosh x - 3\sinh x + 1 = 0$ , correct to four decimal places. (8 marks) Simplify:  $(x^2 - )^2 \times \sqrt{(x+1)} \div (x-1)^{\frac{-3}{2}}$ . 4. (a) (3 marks) (b) Solve the equations: (i) log(x-3) + log(x+3) = 2log(x+3) $4(16^{x+4}) \times 5.2^{2x} = 13$ (ii) (9 marks) Solve the equation  $\log_5 y + \log_v 25 = 3$ . (8 marks) (c) 5. The sum of the first four terms of an arithmetic progression is 4, and the difference (a) between the eighth and fourth terms is 12. Determine the: First term and common difference; (i) (ii) Sum of the first twenty one terms. (7 marks) The ratio of the fourth and sixth terms of a geometric progression is 4, and the sum (b) of the first three terms is  $\frac{21}{4}$ . Determine the: (i) First term and common ratio Sum to infinity of the geometric progression. (ii) (7 marks) Determine the polar equation of the parabola  $x^2 = 4(1 + y)$ . (6 marks) (c) Determine the inverse of  $f(x) = \frac{x+4}{2x-5}$ . 6. (4 marks) (a) (b) Convert:  $r = 3(1 + 2\cos\theta)$  to cartesian form (i)  $x^{2} + y^{2} = 7x$  to polar form (ii) (7 marks) Solve the equation  $\log_3 x + \log_x 9 = 3$ (9 marks) (c) Express  $\frac{2+3j}{3+4j}$  in the form a + bj. 7. (a) (3 marks)

(b) If Z = x + yj, find the values of x and y such that  $\frac{1}{z} + \frac{2}{z} = 1 + j$  (6 marks) (c) Use the De Moivre's theorem to show that  $\cos 4\theta = 8\cos^4\theta - 8\cos^2\theta + 1$  (5 marks)

(d) Simplify 
$$3 + 2j + 5(3 - j) + j(3j - 4)$$
 expressing the result in the polar form.(6 marks)

(a) Solve that the following equations for 
$$0^0 \ll x \ll 360^0$$
 given

(i) Tan 2x = 1  
(ii) 
$$\cos^2 x = \frac{1}{4}$$
  
(iii)  $3\cos x + 2 = 0$  (10 marks)

(b) show that 
$$\frac{1}{1+\sin\theta} + \frac{1}{1-\sin\theta} = 2\sec^2\theta$$
 (5 marks)

(c) Given that 
$$SinA = \frac{12}{13}$$
 and  $Cos B = \frac{4}{5}$  where A is obtuse and B is acute, determine the values of ;

i) 
$$Sin(A-B)$$

8.

ii) 
$$Tan (A + B)$$
 (5 marks)
