

MACHAKOS UNIVERSITY

University Examinations 2016/2017

SCHOOL OF PURE AND APPLIED SCIENCES

DEPARTMENT OF PHYSICAL SCIENCES

FIRST YEAR SECOND SEMESTER EXAMINATION FOR BACHELOR OF SCIENCE

IN ELECTRICAL AND ELECTRONICS ENGINEERING

SUPPLEMENTARY EXAMINATION

ECU 102: CHEMISTRY FOR ENGINEERS II

DATE: 30/8/2017

TIME:

INSTRUCTIONS:

- The paper consists of **two** sections.
- Section **A** is **compulsory**.
- Answer any **two** questions from section **B**.
- $R = 8.314 \text{ JK}^{-1}\text{mol}^{-1} = 0.08206 \text{ L atm K}^{-1} \text{ mol}^{-1}$
- $1 \text{ atm} = 760 \text{ mmHg}$

SECTION A - COMPULSORY.

QUESTION ONE

- a) Derive:
- The ideal gas equation (4 marks)
 - The Van der Waals equation (3 marks)
 - An equation for the pressure at the base of a column of liquid of mass density ρ (rho) and height h at the surface of the Earth. (2 marks)
- b) A sample of 3.50 moles of NH_3 gas occupies 5.2 L at 47°C . Calculate the pressure of the gas (in atm) using:
- The ideal gas equation (1 mark)
 - The Van der Waals equation given $a_{\text{NH}_3} = 4.17 \text{ atm L/mol}^2$ and $b_{\text{NH}_3} = 0.0371 \text{ L/mol}$. (1 mark)
- c) i A certain anesthetic compound contains 64.9% carbon, 13.5% hydrogen and 21.6% oxygen. At 120°C and 760 mmHg, 1.00 L of the gaseous compound weighs 2.30 g. What is the molecular formula of the compound? (5 marks)
- ii. In an industrial process, nitrogen is heated to 500 K in a vessel of constant volume. If it enters the vessel at 100 atm and 300 K, what pressure would it exert at the working temperature if it behaved as a perfect gas? (2 marks)
- d) i State the Le Chatelier's principle. (2 marks)
- ii The equilibrium constant K for the formation of nitrosyl chloride from nitric oxide and chlorine:
 $2\text{NO}_{(g)} + \text{Cl}_{2(g)} \leftrightarrow 2\text{NOCl}_{(g)}$ is 6.5×10^4 at 35°C . In which direction will the reactions proceed to reach equilibrium if the starting NO, Cl and NOCl are $1.1 \times 10^{-3} \text{ mol/L}$, $3.5 \times 10^{-4} \text{ mol/L}$ and 1.9 mol/L respectively. (4 marks)
- e) Given the reversible equation: $2\text{SO}_{2(g)} + \text{O}_{2(g)} \leftrightarrow 2\text{SO}_{3(g)}$ $\Delta H = -196 \text{ kJmol}^{-1}$
- Give an equation for equilibrium constant (K_p). (1 mark)
 - The K_p for the above equilibrium reaction is 1.45×10^{-5} at 500°C . Calculate the partial pressure of SO_3 when the partial pressure of SO_2 is 0.928 atmospheres and that of O_2 is 0.432 atmospheres. (2 marks)
 - Calculate the value of K_c at a temperature of 800°C . (1 mark)
 - Explain the effect of (i) increasing pressure (ii) increasing temperature to the above reversible reaction. (2 marks)

SECTION B: ANSWER ANY TWO QUESTIONS
QUESTION TWO

- a) Define the following terms;
- Redox reaction
 - Rate constant
 - Rate of reaction
 - Order of a reaction
 - Reaction intermediate (5 marks)
- b) Define half-life ($t_{1/2}$) and show that for a 1st order rate reaction, the half life ($t_{1/2}$) is independent of initial concentration. (5 marks)
- c) For a 1st order reaction: $2\text{H}_2\text{O}_{2(\text{aq})} \rightarrow 2\text{H}_2\text{O}_{(\text{l})} + \text{O}_{2(\text{g})}$ has a rate constant of $1.06 \times 10^{-3} \text{ min}^{-1}$. If the initial $(\text{H}_2\text{O}_2)_0 = 0.020 \text{ mol/L}$, then what percentage of it remains after 100 minutes of reaction time. (5 marks)
- d) The reaction: $2\text{NOBr}_{(\text{g})} \rightarrow 2\text{NO}_{(\text{g})} + \text{Br}_{2(\text{g})}$ is a second order reaction with respect to NOBr. $k = 0.810 \text{ M}^{-1} \text{ s}^{-1}$ at 10°C . If $(\text{NOBr})_0 = 7.5 \times 10^{-3} \text{ M}$, how much NOBr will be left after a reaction time of 10 minutes? Determine the half-life of this reaction. (5 marks)

QUESTION THREE

- a) Define the following terms;
- Standard electrode potential
 - An anode
 - An electrolytic cell
 - Electromotive force (4 marks)
- b) i Explain the limitations to the use of standard electrode potential. (2 marks)
- ii State the Nernst equation of electrochemical reactions and define all the terms. (3 marks)
- iii An electrochemical cell is made of X (standard electrode potential; $(E^0) = +0.7100 \text{ V}$) and Y ($E^0 = +0.34 \text{ V}$) electrodes.
- Using standard sign conventions, construct a cell expression made of X and Y electrodes (2 marks)
 - If the $(\text{X}^+) = 0.01 \text{ M}$ and $(\text{Y}^{2+}) = 0.1 \text{ M}$ for the above cell, what would be the instantaneous EMF of the cell at 25°C . (4 marks)
- c) i Write the balanced net ionic equation for the reaction:
- $$\text{MnO}_4^- + \text{VO}^{2+} \rightarrow \text{Mn}^{2+} + \text{V}(\text{OH})_4^- \quad (3 \text{ marks})$$
- ii Identify the oxidizing and the reducing agent in the above equation (2 marks)

QUESTION THREE

- a) i State Henry's law. (2 marks)
- ii List the conditions for applicability of Henry's law. (2 marks)
- b) i What is an ideal solution? (1 mark)
- ii Briefly describe properties of an ideal solution. (2 marks)
- iii Sketch plots of vapour pressure versus mole fractions for the binary solution toluene-benzene obeying Raoult's law over the whole concentration range at a certain temperature. Comment on your observations. (4 marks)
- iv Calculate the vapour pressure of a solution containing 11.7 g benzene (MW = 78) and 4.6 g methylbenzene (MW = 92) at 50 °C, if the vapour pressures of the pure components at this temperature are $3.6 \times 10^4 \text{ Nm}^{-2}$ and $1.12 \times 10^4 \text{ Nm}^{-2}$, respectively. (4 marks)
- c) i) What is osmosis? (1 mark)
- ii) A biochemical engineer isolates a bacterial gene fragment and dissolves a 17.6 mg sample of the material in enough water to make 31.5 mL of solution. The osmotic pressure of the solution is 0.340 torr at 25.0 °C. Calculate the molar mass of the gene fragment. (4 marks)

QUESTION FIVE

- a) i) What are colligative properties? (1 mark)
- ii) Give three examples of colligative properties. (3 marks)
- iii) Boiling point elevation is a colligative property. Explain (2 marks)
- iv) Explain the Van't Hoff factor in colligative properties equation. (2 marks)
- v) With an aid of a labeled diagram, describe Landsberger's method for determining the elevation in boiling point of a solvent on dissolving a non-volatile solute in it. (6 marks)
- b) i) What is pH of a solution? (2 marks)
- ii) The dissociation constant of acetic acid at 25 °C is 1.75×10^{-5} . Calculate the degree of dissociation and the pH of the solution in a 0.500 M acetic acid solution. (4 marks)
