

MACHAKOS UNIVERSITY

University Examination 2018/2019

SCHOOL OF ENGINEERING AND TECHNOLOGY

DEPARTMENT OF BUILDING AND CIVIL ENGINEERING

FOURTH YEAR SPECIAL/SUPPLEMENTARY EXAMINATION FOR

BACHELOR IN CIVIL ENGINEERING

ECV 412: DESIGN II

DATE: 31/7/2019

TIME: 8.30-10.30 AM

INSTRUCTIONS: Answer questions **ONE** and any other **TWO** questions.

QUESTION ONE (30 MARKS)

- a) List four types of foundations that may be used in construction of reinforced concrete structures. (4 Marks)
- b) Clearly describe two ways that may be used to achieve pre-stressing in concrete construction. (8 Marks)
- c) A solid footing has to transfer a dead load of 1000 kN and an imposed load of 400 kN from a square column 400 x 400 mm (with 16 mm bars). Assuming $f_y = 415$, and $f_{ck} = 20$ N/mm², and safe bearing capacity to be 200 kN/m², design the footing. (18 Marks)

QUESTION TWO (20 MARKS)

- a) State five serviceability limit states that may be considered during design. (5 Marks)
- b) Design the longitudinal and shear reinforcement for a 275 mm square, short-braced column which supports an ultimate axial load of 1280 kN and bending moments of 35 kNm about the x-x axis and 25 kNm about the y-y axis. Assume $f_{cu} = 30$ N/mm² and $f_y = 460$ N/mm² and cover to all reinforcement is 35 mm. (15 Marks)

QUESTION THREE (20 MARKS)

Design a reinforced concrete slab 6.3 x 4.5 m simply supported on all the four sides. It has to carry a characteristic live load of 10 kN/m² in addition to its dead weight. Assume C25 concrete and $f_y = 415$ N/mm²; also assume that the exposure condition to environment can be classified as mild.

(20 Marks)

QUESTION FOUR (20 MARKS)

- a) Design the longitudinal steel and links for a 300 mm square reinforced concrete column, short-braced which is to carry an ultimate load of 1400 kN, with the following material properties; $f_{cu} = 25 \text{ N/mm}^2$ and $f_y = 460 \text{ N/mm}^2$. (14 Marks)
- b) State any three ways in which a reinforced concrete column may fail under loading. (6 Marks)

QUESTION FIVE (20 MARKS)

A reinforced concrete beam has an overall depth of 500 mm and width of 300 mm. The beam is simply supported on 200 mm wide walls and spans 6 m. The beam is exposed to mild conditions. The beam is to carry an imposed load of 25 kN/m and a dead load of 15 kN/m (including self-weight). Assume $f_{cu} = 30 \text{ N/mm}^2$, $f_y = 460 \text{ N/mm}^2$ and $f_{yv} = 250 \text{ N/mm}^2$, design the beam together with the shear reinforcement. (20 Marks)

Table 3.10 Cross-sectional areas of groups of bars (mm²)

Bar size (mm)	Number of bars									
	1	2	3	4	5	6	7	8	9	10
6	28.3	56.6	84.9	113	142	170	198	226	255	283
8	50.3	101	151	201	252	302	352	402	453	503
10	78.5	157	236	314	393	471	550	628	707	785
12	113	226	339	452	566	679	792	905	1020	1130
16	201	402	603	804	1010	1210	1410	1610	1810	2010
20	314	628	943	1260	1570	1890	2200	2510	2830	3140
